

Step 0 : First understand what Renewal actually means

Suppose I purchased a motor insurance policy.

Customer	Bought Policy
Rahul	10 July 2025

Normally motor insurance is valid for **1 year**.

So

Purchased

10 July 2025

Expires

09 July 2026

Now the company wants me to renew it before expiry.

That is called

Renewal.

Simple.

Step 1 : Why do they work 45-60 days before?

Imagine you own an insurance company.

Would you call a customer on the expiry day?

No.

Because customers might already buy insurance somewhere else.

So companies start reminding customers much earlier.

Usually

60 days before

or

45 days before

Example

Policy expires

15 August

Work starts

15 June

This is what they mean by

45 Days Before Renewal

or

60 Days Before Renewal.

Step 2 : Where does renewal data come from?

This is where Neyaz Sir starts.

Every policy ever sold exists inside

Saiba

Think of it as

Master Insurance Database

Inside SAIBA

Policy Number

Customer

Vehicle

Premium

RM

POSP

Company

Expiry Date

etc.

Everything is stored.

Step 3 : Every month they predict next year's renewals

This part confused you.

Let's understand.

Today is

June 2026

Last year

June 2025

Company sold

100,000 policies.

Since insurance is for one year,

Those same policies

will expire in

June 2026

Therefore

they become

Renewal Candidates.

So they download

All June 2025 business

↓

Expected Renewals in June 2026

Notice

These are only

Expected

Not confirmed.

Step 4 : Why Expected?

Because not every policy renews.

Example

100,000 policies sold.

After one year

Some vehicles were sold.

Some customers died.

Some vehicles totaled.

Some policies were cancelled.

Some companies rejected it.

Some underwriting declined.

Now actual renewals become

85000

Not

100000

That's why Neyaz Sir said

We don't know the actual number until the insurance company gives a file.

Step 5 : They mail every insurance company

Now organization contacts

Tata AIG

ICICI

Bajaj

HDFC

IFFCO

etc.

They ask

Please send a renewal file.

Company replies

Here are policies eligible for renewal.

Here are declined policies.

Here are cancelled.

Here are underwriting rejects.

Here are renewal notices.

Step 6 : Insurance Company sends Renewal Notice

Very important.

Renewal Notice

≠

Policy PDF.

It contains

Policy Number

Expiry

New Premium

GST

Changes

Renewal Premium

Barcode

Payment QR

Payment Link

Think of it as

Invoice

for renewal.

Not an insurance policy.

Step 7 : Different companies send data differently

Some

Portal

Some

Mail

Some

SFTP

Some

Excel

So Neyaz's team manually downloads everything.

Then

Combines everything.

This itself takes

Days

Sometimes Weeks.

Step 8 : Upload Renewal Notices

Now they upload

Only

Renewal Notice PDFs

to

Company Server

or

SFTP

This is where Neyaz Sir's work almost ends.

Now IT starts.

Step 9 : Earlier Process (Old System)

Now Binal Ma'am starts.

Earlier they downloaded

Three Excels.

Excel 1

Renewal Policies

Contains

Policy Number

Vehicle

Expiry

Company

No RM.

No POSP.

Excel 2

RM Details

Contains

Policy Number

RM Name

Excel 3

POSP Details

Contains

Policy Number

POSP

Then

Macro

merged them.

Like SQL JOIN.

Example

Policy

1001

↓

RM File

↓

POSP File

↓

Merged Output

Macro took

8 Hours

10 Hours

12 Hours

Because

100000 rows.

Step 10 : Binal removed Macro

Instead of Excel

She wrote

Stored Procedure

inside the SAIBA Database.

Instead of

Excel

↓

Macro

↓

Excel

↓

Upload

Now

Database

↓

Stored Procedure

↓

Ready Data

Very fast.

No Macro.

Step 11 : Stored Procedure Logic

Suppose

Today

1 June

Stored Procedure runs.

It fetches

1 July

↓

15 August

Which is roughly

45 days ahead.

Meaning

Prepare upcoming renewals.

Then

On

1 July

Again

Procedure runs.

Now it fetches

1 August

↓

15 September

Why?

To catch missed policies.

Suppose one policy was missing.

It gets picked next cycle.

Hence

No renewal missed.

Step 12 : Mapping Renewal Notice

Now

Renewal Notice PDF arrives.

It contains

Policy Number

12345

Database contains

Policy Number

12345

↓

RM

↓

POSP

↓

Region

↓

LOB

System matches

Policy Number

This is the unique key.

After matching

Now Renewal Notice becomes visible to

Correct RM.

Correct POSP.

Correct Region.

Automatically.

Step 13 : Payment Link

Another interesting automation.

Sometimes company sends

Bitly Links

or

Payment URL

Example

Policy

12345

↓

<https://bit.ly/xxxxx>

Instead of manually updating every policy

Business uploads one Excel

Policy

Bitly

Backend

matches

Policy Number

updates database.

Done.

Step 14 : Customer Login

Customer logs in.

System checks

Renewal Notice exists?

↓

Show PDF

Payment Link exists?

↓

Show Payment Button.

Everything is automatic.

Step 15 : Reminder System

Binal explained another concept.

Renewal Notice

and

Reminder

are different.

Renewal Notice

Only Once

Reminder

Multiple Times.

Example

45 Days

↓

30 Days

↓

15 Days

↓

7 Days

↓

3 Days

↓

1 Day

Customers keep getting reminders.

Step 16 : RM Reminder

Imagine

RM has

700 policies.

Sending

700 WhatsApps

is useless.

Instead

System sends

Motor

10

Health

5

Life

2

One summary.

RM understands.

Step 17 : Auto Renewal Detection

Suppose a customer renews online.

Night Job runs.

Checks

Vehicle Registration Number.

Example

MH01AB1234

Searches

Same Registration

Same Year

If found

Flag

Renewed = Yes

No manual work.

Step 18 : Dashboard

Finally comes your project.

Everything above exists to feed the dashboard.

Dashboard should answer questions like:

Business Questions

How many renewals are due?

100000

How many renewed?

45000

Pending?

55000

Region wise

Mumbai

Delhi

Assam

Gujarat

LOB wise

Motor

Health

Commercial

Private Car

Two Wheeler

RM wise

Who renewed most?

POSP wise

Performance

Daily Trend

1 July

↓

500 Renewals

2 July

↓

650

3 July

↓

900

Company Wise

Tata

ICICI

Bajaj

Renewal %

Renewed

/

Eligible

×100

Premium

Expected Premium

Collected Premium

Future Calendar

Tomorrow

7000 Due

Day After

6500 Due

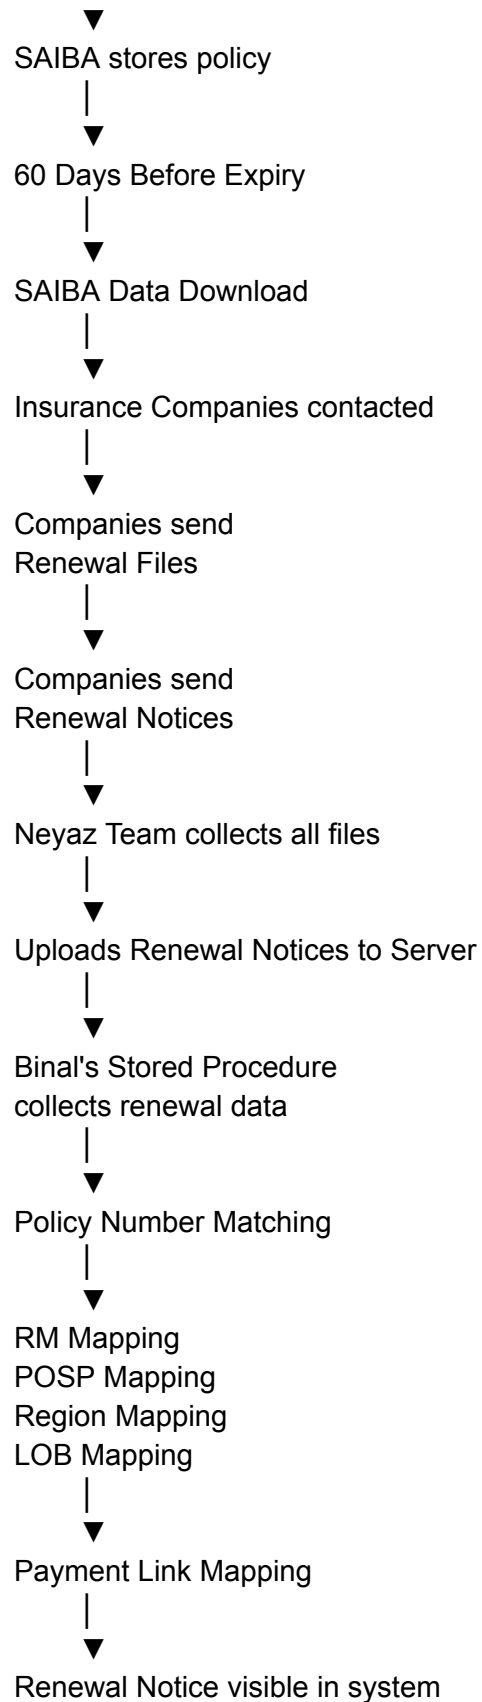

Next Week

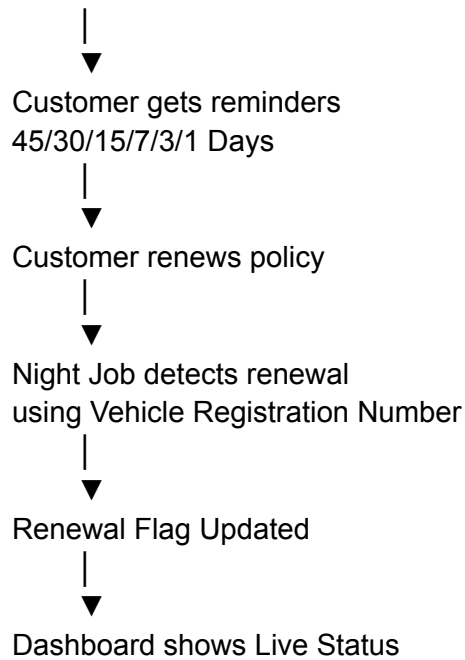

9000 Due

Finally, the complete renewal flow

Customer buys policy

|

From a software engineer's perspective, your project is **not primarily an insurance project**. It's a **data engineering and business intelligence pipeline**:

1. Collect renewal data from multiple sources (SAIBA + insurance companies).
2. Clean and consolidate it.
3. Enrich it with RM, POSP, region, product, and payment links.
4. Track renewal progress over time.
5. Expose everything through a dashboard so business teams no longer have to prepare manual Excel reports.

Once you see it as a data pipeline rather than an insurance workflow, the overall architecture becomes much easier to reason about.

So renewal notice is sent by the company to our portal , Neyaz sir downloads it and then what happens is that he uploads on the SFTP and then asks for the bitly link or the company provides the bitly link , so uploads on the portal of probus

So then Binal madam gets everything , maps it using the control number and gives it to Neyaz sir .

You may require total dump (renewal) data
And renewed data right so as to calculate the things
